MVP Document

AI-Powered CX Analysis

1. Overview

Teams collect customer survey data but rarely have the time or tooling to turn it into decisions. Enterprise platforms are powerful but expensive and slow to adopt; spreadsheets are cheap but shallow, and open-text comments usually go unread.

Product vision: Upload a survey file and, within minutes, get a CX dashboard, sentiment and theme analysis of open-text feedback, and AI-generated insights that say what is going wrong and what to investigate next.

Core flow: Survey file → Dashboard → Analysis → Insights

2. Problem Statement and Goals

Problem	MVP Goal
CX scores sit in spreadsheets with no trend or segment view	Instant dashboard with NPS, CSAT and trends
Open-text comments are too numerous to read manually	Automatic sentiment and theme extraction
Analysts spend days on manual analysis and reporting	AI-generated summary of key problems in minutes
Leaders ask “why did the score drop?”	Segment drill-down plus suggested areas to investigate

Success looks like: a first-time user goes from CSV upload to a meaningful insight in under 10 minutes without training.

3. Target Users

- **CX / Product Managers:** track satisfaction and prioritise fixes.
- **Business Analysts:** need fast analysis without building models.
- **Leadership:** want a concise, trustworthy view of customer health.

4. MVP Scope

4.1 Data upload

- CSV upload (Excel .xlsx support planned for the next phase).
- Column mapping: user maps their columns to standard fields (NPS score, CSAT score, date, comment, segment fields).
- Basic validation: missing values, invalid score ranges, encoding problems, with clear error messages.

4.2 CX dashboard

- **NPS:** % Promoters (9-10) minus % Detractors (0-6), with the promoter / passive / detractor split.
- **CSAT:** % satisfied responses (e.g. 4-5 on a 5-point scale) and average score.
- **Trends:** NPS, CSAT and response volume over time (weekly / monthly).
- **Basic metrics:** total responses, response rate (if available), score distribution, comment count.

4.3 Segmentation and filtering

- Filter by product, region, customer type, date range and any other categorical column.
- Filters apply globally to all charts, text analysis and insights.
- Side-by-side segment comparison (e.g. NPS by region).

4.4 Open-text analysis

- **Sentiment:** positive / neutral / negative per comment, with aggregate sentiment share.
- **Theme detection:** LLM-based clustering of comments into major themes (e.g. delivery delays, app performance, support wait time).
- Per theme: volume, sentiment split, link to low scores, and representative example comments.

4.5 AI-generated insights

- One-click report answering: “What are the key CX problems and what should we investigate?”
- Output: top issues ranked by impact, notable trend changes, underperforming segments and suggested follow-up investigations.
- Every insight links back to the underlying data (charts and comments) so users can verify it.

Out of scope (later phases)

Excel upload, live survey/CRM integrations, real-time streaming, automated alerts, multi-language support, predictive churn models, user roles and collaboration, white-labelling.

5. User Flow

1) Upload a CSV file. 2) Map and validate columns, preview rows. 3) View dashboard with headline NPS/CSAT, trends and metrics. 4) Filter and segment to see where scores differ. 5) Explore text themes and sentiment. 6) Generate insights and export or share the summary.

6. Competitive Landscape

Product	Positioning	Strengths	Gaps we can exploit
Medallia	Enterprise experience management with advanced CX analytics	Deep analytics, omnichannel data, large-scale text and speech analytics	High cost, long implementation, heavy for small and mid-size teams
Qualtrics	Survey creation plus CX/XM platform	Strong survey design, broad features, powerful text analytics	Complex to configure, enterprise pricing, insights need analyst effort
SurveyMonkey	Simple survey and feedback tool	Easy to use, affordable, fast setup	Limited open-text depth and proactive insights

Positioning: the simplicity of SurveyMonkey with the analytical depth of Medallia and Qualtrics, driven by AI, and starting from data the team already has. **Differentiators:** zero-setup upload workflow, AI-written insights instead of just charts, fast time-to-value.

7. Technical Approach (High Level)

- **Frontend:** web app with upload, dashboard (charts and filters) and insights views.
- **Backend:** API for file ingestion, validation, metric calculation and AI orchestration.
- **Data layer:** parse CSV into a structured store; compute NPS, CSAT and trends in code, not by the LLM, to keep numbers accurate.
- **AI layer:** LLM for sentiment, theme extraction and insight generation, using aggregated stats and sampled comments as context with structured (JSON) output.
- **Design principle:** numbers come from code, narrative comes from AI, which reduces hallucination risk.
- **Privacy:** encryption in transit and at rest, user-controlled data deletion, PII masking before text goes to the model.

8. Success Metrics

Category	Metric	MVP Target
Activation	Users who upload a file and view the dashboard	> 70%
Speed	Upload to insights time (up to 10k rows)	< 1 minute
Accuracy	Dashboard metrics match manual calculation	100%
AI quality	Theme and sentiment agreement with human review	> 80%
Value	Users rating insights “useful”	> 4 / 5

9. Risks and Mitigations

Risk	Mitigation
Inconsistent CSV formats break parsing	Column mapping, validation, downloadable sample template
AI produces inaccurate or generic insights	Compute stats in code, ground insights in data, show supporting evidence
Sensitive customer data exposure	PII masking, encryption, clear data-retention policy
Large files slow processing	Batch and sample comments, async processing with progress indicator
Differentiation vs. established vendors	Focus on speed, simplicity and AI-written insights for underserved teams

10. Proposed Timeline (8 Weeks)

Weeks	Milestone
1	Requirements, sample datasets, UX wireframes, architecture
2	CSV upload, validation, column mapping, NPS/CSAT dashboard
3	Filtering and segmentation, trend charts
4-5	Sentiment and theme analysis pipeline
6-7	AI insights generation, evidence linking, export
8	Pilot user testing, fixes, launch readiness
